▷ DESCRIPTION

The flushing valve, also called exchange valve is used to bleed the hot oil toward a cooler in the hydrostatic transmission. As the cooled oil continuously regulates the hydraulic circuit temperature, the flushing valve operation increases the fluid quality, thus the life span of the transmission. Our FLUID-SYSTEM flushing valve can be installed on any type of hydraulic circuit. This valve is customizable and can be modified as per our customer's application type. The pressure exchange can also be adjusted to complement our customer's needs.
